Press release

VINCI signs 2 contracts for the design/build of waste-to-energy waste treatment centres in the UK

VINCI Environment UK, a company owned 50/50 by VINCI Environnement and VINCI Construction UK, has been selected to create two major waste treatment facilities, worth a total of more than 380 million euros, in the counties of Hertfordshire and North Yorkshire, UK. These successes demonstrate the effectiveness of VINCI's systems integration business model, which brings together its expertise in the areas of waste treatment and civil engineering to create synergies and produce a high-performance comprehensive solution.

In Hertfordshire, VINCI Environment UK has been appointed by VEOLIA Environmental Services to design-build a future waste treatment centre. Providing an alternative to sending waste to landfill, this multi-stream facility will enable some 10% of the waste to be recycled, with the rest being incinerated to produce enough electricity to power the equivalent of 50,000 homes. The works are due to start in late 2013, with entry into service scheduled for spring 2016.

VINCI Environment UK and VINCI Construction UK have been chosen by AmeyCespa for the design-build of the energy recovery unit, overall site development and civil engineering for the buildings of the future multi-stream Waste Recovery Park that will serve North Yorkshire and the city of York in the UK. The future installation will reduce by at least 90% the amount of household waste destined for landfill, currently a little over half the waste generated each year by the county's 760,000 residents. Incineration of household waste will produce enough electricity to supply up to 40,000 homes. The works are due to start in autumn 2012, with entry into service scheduled for late 2015.
